Response to Arguments

1. In view of the appeal brief filed on September 9th, 2004, PROSECUTION IS HEREBY REOPENED. A new ground or rejection is set forth below.

To avoid abandonment of the application, appellant must exercise one of the following two options:

(1) file a reply under 37 CFR 1.111 (if this Office action is non-final) or a reply under 37 CFR 1.113 (if this Office action is final); or,

(2) request reinstatement of the appeal.

If reinstatement of the appeal is requested, such request must be accompanied by a supplemental appeal brief, but no new amendments, affidavits (37 CFR 1.130, 1.131 or 1.132) or other evidence are permitted. See 37 CFR 1.193(b)(2).

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 12-36 and 39-63 rejected under 35 U.S.C. 103(a) as being unpatentable over Candelore (U.S. Patent No. 6,057,872) in view of Civanlar (U.S. Patent No. 6,005,935)

Art Unit: 3621

4. As per claim 12, Candelore teaches an electronic commerce system (*transaction communication system*,, *fig 1*) comprising a client computer (*receiving end, 130*) and a server computer (*transmitting end, 110*), (*see fig 1*) the client computer and the server computer being interconnected (*channel, 120*) by a public packet switched communications network (*see fig 1, column 5 lines 6-25*), the client computer being programmed to transmit to the server computer an order acceptance request comprising a plurality of terms or conditions of a proposed offer for a purchase, the order acceptance request comprising a discrete message that includes at least one of the modular elements individually protected by a cryptographic security code being a digital coupon (*see fig 1, 2, column 5 lines 6-25, 7 lines 19-9 line 65*), the server computer being programmed to process the order acceptance request based on pre-programmed criteria, including authentication of the cryptographic security codes embedded within each of the modular elements and examination of the modular elements of the discrete message individually protected by the cryptographic security codes, and, based on the processing of the order acceptance request, to transmit to the client computer an order acceptance response based on the pre-programmed criteria, the order acceptance response comprising a discrete message transmitted during a negotiation phase of a transaction that includes a plurality of modular elements whose individual integrity is protected by embedding cryptographic security codes within each of the modular elements, wherein the client computer is programmed to receive the digital coupon, protected by a cryptographic security code (*keys*), from another computer (*see fig 1, 2, column 5 lines 6-25, 7 lines 19-9 line 65*). Candolre fails to teach an inventive concept of a plurality of modular elements whose individual integrity is protected by embedding cryptographic security codes within each of the modular elements. However, Civanlar teaches a

Art Unit: 3621

plurality of modular elements whose individual integrity is protected by embedding cryptographic security codes within each of the modular elements (*see column 1 line 46-55, 2 lines 6-45, 2 lines 65-3 lines 40*). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the inventive concept of Candelore to include Civanlar's a plurality of modular elements whose individual integrity is protected by embedding cryptographic security codes within each of the modular elements, because this would have provided a system and method which uses personal information as a key for protecting information sent over a communications network

5. As per claim 13-36, 39-63, they disclose the same inventive concept as claim 12. Therefore, they are rejected under the same rationale.
